

Reversible Graph Algorithms

1. 研究分野

可逆コンピューティング
 ー可逆アルゴリズム

2. 目的

時間・空間計算量の観点で効率の良い可逆アルゴリズムを提案する
 (UNIVERSITY OF COPENHAGEN Thesis)

3. 背景

引き続き調査

4. アプローチ

- ・ Janusにおいて効率良くグラフを表すデータ構造
 - (左) adjacency matrix : 行列で表す方法(無駄が多い)
 - (右) adjacency list : matrixに比べて無駄がない

adjacency list : ノードを表すnodes[]とエッジを表すG[]から成り立つ
 ーnodes : Index Valueを持つ(Gにおいてnodeのエッジを指す部分がどこからか)
 ーG: グラフのエッジ全ての情報を持つ

* adjacency list の情報を拡張することが可能(重みをつけるなど)
 e.g. $G[10][2] = \{\dots\}$, {この部分の情報を自由に追加可能}

Data Structure

adjacency matrix

	a	b	c	d	e
a	0	1	0	1	0
b	0	0	0	0	0
c	0	0	0	0	0
d	0	0	1	0	1
e	0	1	0	0	0

(b) Directed unweighted graph.

each edge has room for 1.
 each node has room for 2.
 additional information.

```

1  int G[10][2] = {{2}, {4}, a
2  2, {1}, {5}, b
3  4, {4}, c
4  5, {1}, {3}, {5}, d
5  6, {2}, {4}} e
6  int nodes[5][3] = {0, 2, 4, 5, 8}
    
```

index values.

Nodes	a	b	c	d	e					
Index values	0	2	4	5	8					
Additional node info " 0 * 0 * 0 * 0 * 0 "										
(a) Array r, node information.										
Indexes	0	1	2	3	4	5	6	7	8	9
Adjacent nodes	b	d	a	e	d	a	c	e	b	d
Additional edge info " 0 * 0 * 0 * 0 * 0 * 0 * 0 * 0 * 0 * 0 "										

3 e.g. weight.

• 可逆深さ優先探索

— 時間計算量・空間計算量：非可逆な可逆深さ優先探索と同じ

— ゴミ出力：入力以外のゴミ出力なし(配列に開始・終了時刻を格納する場所が必要)

Depths first search

```

1 procedure DFS(int G[], int nodes[])
2   local int time = 0, int i = 0
3
4   // We run through each individual node and check if they have been visited
5   // (timestamped). If they haven't we run DFSvisit.
6   from i = 0 do
7     if nodes[i][1] = 0 then
8       call DFSvisit(G, nodes, i, time)
9       fi nodes[i][2] = time
10      i += 1
11    until i = size(nodes)
12
13  delocal int time = size(nodes) * 2, int i = size(nodes)

```

```

1 procedure DFSvisit(int G[], int nodes[], int u, int time)
2   // The time is incremented and the node gets entry-timestamped
3   time += 1
4   nodes[u][1] += time ← entry - timestamp
5
6   // end contains a pointer to the end of adjacency list
7   local int end = 0
8   if u = size(nodes) - 1 then
9     // If we try to get the last list we stop at the end of the element list
10    end += size(G)
11  else
12    // Or else, we stop where the next list starts
13    end += nodes[u + 1][0]
14    fi u = size(nodes) - 1
15
16    // The adjacent nodes are checked and if they have not been visited,
17    // DFSvisit is called with the unvisited node
18    local int r = nodes[u][0] // Pointer to the current node
19    from r = nodes[u][0] do
20      if nodes[G[r]-1][1] = 0 then // The adjacent node's first time stamp is 0
21        call DFSvisit(G, nodes, G[r]-1, time)
22        fi nodes[G[r]-1][2] = time // The adjacent node's second time matches the current time
23      r += 1
24    until r = end
25    delocal int r = end
26
27    // The time is incremented and the node gets exit-timestamped
28    time += 1
29    nodes[u][2] += time ← exit - timestamp.
30
31    // end is delocalated
32    if u = size(nodes) - 1 then
33      end -= size(G)
34    else
35      end -= nodes[u + 1][0]
36    fi u = size(nodes) - 1
37    delocal int end = 0

```

e.g. if $u = 2 (c)$ then $end = 5$ because index value $d = 5$

} DFS.
like irreversible. DFS.
(recursive)
↳ O(E)

$i = 0, time = 0$
 $nodes[0][1] = 0 \leftarrow nodes[0] = a$
 $\hookrightarrow start_timestamp = 1 \leftarrow in DFS\ visit.$
 $nodes[2][1] = 0 \leftarrow nodes[2] = b$
 $\rightarrow to b.$

$i = 0, time = 1$
 $nodes[2][1] = 0 \leftarrow nodes[2] = b.$
 $start_timestamp = 2 \leftarrow in DFS\ visit.$
